

3 KEYS for Successful Proactive Chemical Management

Countries are constantly updating their lists of regulated substances. When you are managing a large portfolio of chemicals, “keeping up” with those changes might not be the best approach. At Sphera, we believe that a proactive approach to Chemical Management is the way forward.

Here are the top three keys to proactively managing your chemicals:

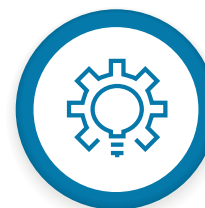

Leverage Existing Information:

One of the best indicators of which substances could show up on a banned list is knowing what that chemical’s status is in other countries or regions. If there is a ban on a substance in Country A, Country B may follow suit. Knowing this ahead of time makes it possible for you to plan ahead.

Take Advantage of Technology:

Having a system in place in place that can reliably and accurately identify chemical hazard risk, regulatory burden risk and the risk of pouring money into development that might not take place is key.

Succinct Insights:

Fast, accurate reports and insights make it easy to flag potential issues. Knowing what substances are where at any given moment gives you total control over your Chemical Management and the safety of your team.

With Sphera’s Chemical Management software, you and your teams can access the information you need to keep operations running smoothly and safety. Our Express Chemical Management option allows you to access the right features to manage your Chemical Management program at the right price.
